
Phone Shortcuts User Guide

Phone Shortcuts is a software tool which allows you to start the applications faster using shortcuts, hotkeys and the start at boot (autoboot) feature. The main screen of the application shows you a grid of 3x4=12 entries. Each entry is a shortcut for which you can associate an application and edit its settings in order to start it faster. Also, each shortcut is associated by default with the phone's numeric keys from 1-9, 0, * and # (hotkeys).

When the **Phone Shortcuts** tool is started and the main screen is shown, select the desired shortcut and press the joystick or directly press the associated key (hotkey) in order to start the application.

Depending on your settings, each application defined for a shortcut can also be started by pressing the associated key (hotkey) for a specified period of time even the **Phone Shortcuts** is not running. You can keep the hotkey pressed for its timeout no matter what the phone shows and the application will be started.

To edit a shortcut, use the **Options->Edit shortcut** command and complete the settings as follows:

- 1 **Select application.** Allows you to select the application to start. Use the first item in list called **None (empty)** if you do not wish an application to be selected for Phone Shortcuts (shortcut empty).
- 2 **Shortcut hotkey.** This is the associated hotkey which lets you start the application even the **Phone Shortcuts** is not running. If this setting is set on **Disabled** the application can not be started by its hotkey. You must start first the **Phone Shortcuts** tool and use the **Options->Start application** or the joystick in order to start it. If set on **Enabled**, this setting will show the associated hotkey (ex: Enabled – Key 3). In this case you can start the application by pressing the hotkey for the time specified in the **Hotkey timeout** setting. The application will start even the **Phone Shortcuts** tool is not running.
- 3 **Hotkey timeout.** Allows you to set the timeout for the hotkey you have to keep pressed to start the application defined for shortcut.
- 4 **Hotkey ignores keylock.** If set on **Yes**, while you keep the hotkey pressed for its timeout, the application will be started no matter if the keypad is locked or not. If set on **No**, you must first unlock the keypad (if locked) and then use the hotkey in order to start the application.
- 5 **Start at boot.** If set on **Yes**, the application will be started when the phone boots/starts (on power on). Only 5 applications are allowed to be started at the boot time (power on). **Note:** If you set to start at the boot time heavy processing applications (java enabled or games) some of them will not start due to low memory available.

To change the general settings of the **Phone Shortcuts** tool use the **Options->Settings** command as follows:

- 1 **Start app. then Exit.** If set on **Yes** and you start an application from the main screen using the joystick, associated key or the **Options->Start application** command, the application will be started and the **Phone Shortcuts** tool will exit. If set on **No**, the **Phone Shortcuts** will not be exited after you start an application from the shortcuts grid.
- 2 **Hotkey state.** If this is set on **Enabled – Key Clear (C)** then you can start the **Phone Shortcuts** tool keeping the **key C** (clear) pressed for the timeout you set in the **Hotkey timeout** field.
- 3 **Hotkey timeout.** Allows you to set the timeout for the **key C** (clear) you have to keep pressed in order to start the **Phone Shortcuts** tool.
- 4 **Hotkey ignores keylock.** If set on **Yes**, while you keep the **key C** (clear) pressed for its timeout, the **Phone Shortcuts** tool will be started no matter if the keypad is locked or not. If set on **No**, you must first unlock the keypad (if locked) and then use the **key C** (clear) in order to start the **Phone Shortcuts** tool.
- 5 **Autostart at boot.** If set on **Yes**, the **Phone Shortcuts** tool will automatically start at the boot time (phone power on).

If you enable hotkeys for applications, the default built-in long key press features of the phone will no longer have effect on some phones. (eg. speed dial (key 1), voice mail box (2-9) or the profile switcher (key #) will not anymore work). Do not enable hotkeys in the **Phone Shortcuts** tool for applications if you want to use the normal built-in phone long key press features. In this case, use the long key press **C (clear)** to start the **Phone Shortcuts** tool then select the application to start using the joystick or the associated key.
